# 1 Introduction

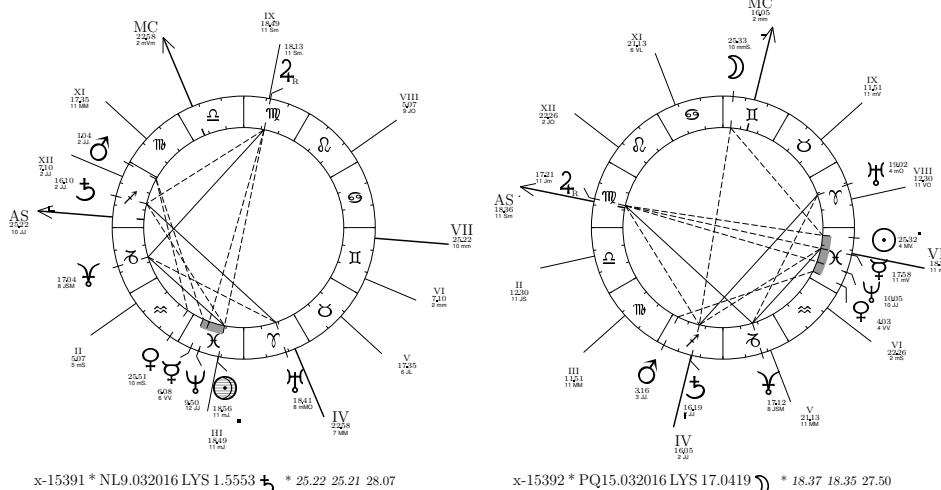

These pages are destined for astrologers. They show on a single page astrological and weather data for each lunation. They are intended to provide help in finding correlation — if any — between astrological indicators and the weather.

Astrological data is represented by four charts, one for each lunar phase. Weather data is shown graphically.

These pages cover a period of time from January 1996 to August 2019 included and are applied to the area of Lyon (France). There are extra pages of future lunations available — to help astrologers' research in this field. As an example, here is the page (reduced size) for the lunation cycle which started on March 9th, 2016 (for full details, see next page).

## 2 Abbreviations

AS : ASC

DQ : (Dernier Quartier) = last quarter of Moon

DS : DSC

IL : (ingrès lunaire) = lunar ingress : Moon enters a new sign

IS : (ingrès solaire) = solar ingress : Sun enters a new sign

LYS : (aéroport Lyon-Saint-Exupéry) = code for Lyon's Airport

NL : (nouvelle Lune) = new Moon

PL : (pleine Lune) = full Moon

PQ : (premier quartier) = first quarter

SYNOP : data format for weather informations, as used by WMO

WMO : World Meteorological Organization

em.tn : (écart à la moyenne pour la température minimale) = deviation for minimum temperature

em.tx : (écart à la moyenne pour la température maximale) = deviation for maximum temperature

n : (nébulosité, nuages) = clouds

p : (précipitations) = rain

t : température

tn : températures minimales = minimum temperatures

tx : températures maximales = maximum temperatures

u : (humidité) = moisture

v : (vent) = wind

**Days of week :** Di (Dimanche)= Sunday ; Lu (Lundi)= Monday, then Ma (Mardi), Me (Mercredi), Je (Jeudi), Ve (Vendredi) and Sa (Samedi)= Saturday

## 3 How to read a page

The following examples are about the lunation cycle that occurred on Mars 9th 2016. See previous page.

Upper left corner : software internal reference ; below is the creation date of the page. Then follows \* and types of aspects

- M = major aspects ;
- pp = aspects from planet to planet (aspects between a planet and an angle are not shown)
- a+s = applying and separating aspects.

Upper right corner : name of the first chart of that page, that is the New Moon. Day of week (French names ; see abbreviations above), date (format= j/mm/aaaa). And x-any number (internal reference). Further below is the name of the chart we use.

A chart's name is made as follows : 2 capital letters (NL= new Moon, PQ= first quarter, PL= full Moon, DQ= last quarter), then the date (format= D.MMAAAA) and three capital letters to identify the location for which the chart is cast (here : LYS = Lyon-Saint-Exupéry airport, where the weather data come from).

### 3.1 Astrological data

#### 3.1.1 lunations :

There are four charts for each lunation. To be read from upper left, then upper right, then lower left and finally lower right. Tropical zodiac. Placidus houses.

Below each chart are : its number and name, time (format= h.minutes), planetary hour. Then a \* and three numbers with two decimal digits : that is the longitude (format d.mm) in their own signs of part of fortune according to diurnal formula (AS+Moon–Sun), nocturnal formula (AS+Sun–Moon), and “part of acts” (AS+Moon–Saturn). The sign in which the part is located is not shown but these points are indicated in the following manner :

- part of fortune *diurnal* : short vertical line located at 12 mm outside the largest circle ;
- part of fortune *nocturnal* : short horizontal line located same way ;
- part of acts : small black square located the same way ;

Of course, parts of fortune are located on the ASC in a new Moon chart, on the DSC in a full Moon chart, and are square the horizon at first and last quarters.

When there is an eclipse, the eclipsed luminary is shown hatched (this is the case in the lunation shown as an example) ; the chart is cast for the time of the luminaries' conjunction or opposition, and this time usually doesn't correspond to the time of the maximum phase of the eclipse.

Right above the weather data there is a line with planets entering another sign or changing direction (going D or R) during this lunation cycle, and when : day of month and a letter in italics : *m* for morning, *a* for pm ("après-midi" in French), *s* for evening ("soir" in French) until midnight, and *n* for night, from 0 h until approx sunrise.

### 3.1.2 four seasons :

At the beginning of a new season there is a special page with 6 charts and no weather data.

On these pages, the chart of the solar ingress of the coming season is shown up right. That is when the Sun enters a cardinal sign. On the left there is the chart of the former Aries solar ingress (the beginning of the solar year). The four other charts are the three new moons of the season and then the solar ingress for the next season (or — as this may happen — the chart of the fourth new Moon of the current season : for example in Summer 2001 or Spring 2004).

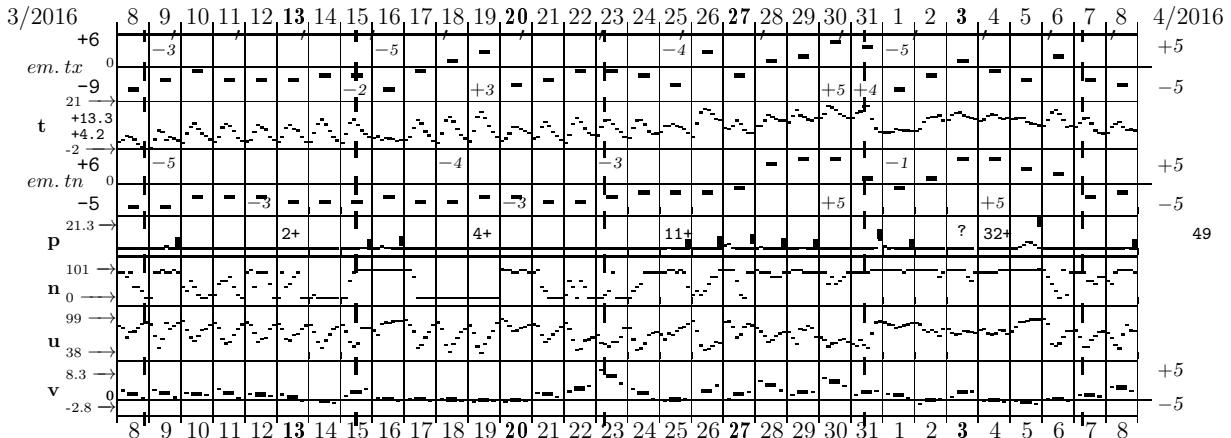

Notice that, on these pages, the name written on the top right corner is the second chart's name, which is the main chart of this page. As it's a solar ingress chart (in French : *ingrès solaire*), its name starts with the two letters IS.

## 3.2 Weather data

The weather graphic is based on offical data named « *données SYNOP essentielles OMM* », (essential data of World Meteorologial Organization) available at <https://donneespubliques.meteofrance.fr>. These data are freely available, thanks to Meteo-France.

The data is daily, for every three hours (8 data sets / day for numerous parameters).

### 3.2.1 the weather data graphic

The timeline is horizontal. On the top line : month and year, and number of the day. Sundays are in bold. Same goes for the bottom line.

**Important notice :** the border between two days is a small vertical line. In these pages, the beginning of the day is not 0 h, *midnight* but 3 h UT for months May, June and July, and 6 h UT for the other months (this is to be as close to the sunrise as possible in the area for which the charts are drown).

Right below the days of month, special marks / indicate when Moon enters a new sign.

Thick vertical lines shows the beginning of a lunar phase, and the first one is the day and the approximate time of the new Moon (notice that is our example, the thick line appears on day 8, near its end, even if the date of the new Moon is March 9th at 1 h 56m UT : this is due to the new Moon occurring during the 24 hours cycle that started on the 8th at sunrise).

Below this top line are 7 graphs showing 5 weather parameters. The first three graphs are about temperature (**t**). Then rain (precipitations= **p**), then clouds (nébulosité, nuages= **n**), then moist (**u**), and then wind (vent= **v**). For temperature (**t**), rain (**p**), clouds (**n**) et moisture (**u**), there is one mark every three hours. For wind (**v**), one small mark for day, one small mark for night, and between these two dots, a larger one for the average of the entire cycle; here, day and night have an equal 12 hours duration (see further for details).

The five weather parameters are shown in the left margin :

- t** = temperature (in Celsius degrees)
- p** = precipitations, rain (in mm)
- n** = clouds (from 0 to 101)
- u** = moisture
- v** = wind (mean deviation, in m/s)

- *Details about the 3 graphs “Températures” : see mark **t** in the left margin*

Top : maximum temperatures (mark *em.tx* in the left margin) ; lower : minimum temperatures (mark *em.tn*) ; middle (mark **t** in the left margin) : actual temperatures : there are 8 data sets for 24 hours, this is the graph that most looks like a sinusoid. Upper and lower borders of this sinusoid are a thin horizontal line showing maximum and minimum temperatures of the whole lunation ; those temperatures are written in the left margin (rounded up to integral value for maximum, rounded down for minimum).

Example : minimum temperature =  $-2^{\circ}\text{C}$  during the night from 8th to au 9th of March ; maximum temperature =  $21^{\circ}\text{C}$  during the day of March 30th.

Between these two temperatures there are two other ones : these are the average of the maximum temperatures for the entire lunation cycle and, below, the average of the minimum temperatures. Example : mean maximum temperature =  $+13.3^{\circ}\text{C}$  ; mean minimum temperature =  $+4.2^{\circ}\text{C}$ .

Upper and lower temperatures graphs show deviation for maximum and minimum temperatures. In both graphs, a thin horizontal lines goes outside on the right side and has the mark ‘0’ in the left margin : this line show the normal temperature ; above and below this ‘0’ mark in the left margin there are two numbers, one with positive value and the other one with negative value : these numbers, in degrees Celsius, indicate the deviation from mean temperature of maximum and minimum values.

For example : on March 17th, the maximum temperature is normal, but on March 30th and 31st it's almost 6 degrees Celsius above normal. About minimum : these temperatures have clearly been below normal temperature until March 22nd, and above the normal from the 28th.

In these two graphs (maximum and minimum temperatures), and for each lunar phase, there are two numbers *in italics*, one usually positive and the other one usually negative. They show maximum deviation and minimum deviation for maximum temperatures (upper graph : *em.tx*) and for minimum temperatures deviation (lower graph : *em.tn*). They are indicated in the column of the day of their taking place.

For example : during the third lunar phase (PL), the biggest positive deviation for maximum temperatures is  $+5$ , on March 30th. The biggest negative deviation is  $-4$ , on March 25th.

Biggest deviations occuring during the whole lunation are written *in italics* in the right margin. Example : for maximum temperatures, positive deviation is  $+5$ , and negative deviation is  $-5$  ; for minimum temperatures : positive deviation is  $+4$ , and negative deviation is  $-5$ .

NB : about mean values, normal values and deviations, see below : important notice about calculation of mean and normal values and deviations.

It's useful to know deviations in each lunar phase to have a more precise idea of the weather : we can easily spot if temperatures are in the range of the season, or if they differ from the normal (and by which quantity).

- *Details about graph “Precipitations” (rain) : see mark **p** in the left margin.*

There are eight values per 24 h, showed by a single dot. At the end of the day, a thick mark located at different eights shows the total amount of rain during these 24 hours. If there is no mark, that means there has been no rain on that day.

For example : on April 5th, it rained at the end of the day and at the beginning of the night, with a high total (21.3 mm ; that is the max day total of the entire lunation, as indicated in the left margin). When the graph is flat but with a short thick mark at the end of the day, that means there has been very little rain (in French : “traces de pluie”) : that was the case on March 25th. On the contrary, there has been no rain at all from March 17th to March 24th included.

Notice : sometimes, a data set is missing in the weather data provided by WMO. As a result, when other data for a day show no rain, we cannot be sure there was no rain at all during that day. When this occurs, there is a ? for this day in the graph **p** (as an exemple, see April 3rd).

In this graph, and for each lunar phase, there is a number (sometimes followed by the + sign). This shows the total amount of rain (in mm, rounded up when higher than 1) during this lunar phase. When there is at least one missing data set during this lunar phase, this number is followed by the + sign because it is possible that the actual amount of rain is higher than the sum of the known data sets.

At the end of this graph, written in the right margin, there is the total amount of rain during the entire lunation. Here : 49.

- *Details about graph “Clouds”* : see mark **n** [n for “nébulosité, nuages”] in the left margin.

Eight data sets per day. Some days are without any cloud, like 18th and 19th of March ; other days are always cloudy, like March 16th or April 5th, for example.

- *Details about graph “Moisture”* : see mark **u** in the left margin.

Eight data sets per day. This graph is easy to read.

- *Details about graph “Wind”* : see mark **v** [n for “vent”] in the left margin

Wind speeds considered here are not gusts but the average speed for a ten minutes period.

Every day : the first dot shows the mean value of wind speed during the day ; then an horizontal thick mark shows the average wind speed during the 24 hours ; the last dot shows the average value of wind speed during the night.

Reminder : in these documents, the day starts at 3 h UT in May, June and July, and at 6 h UT the other months. Both daytime and nighttime are 12 hours long.

This graph shows deviations from the mean value, not the actual value of the wind speed (this is why the lowest value, which is written in the left margin, generally is a negative value). The deviation values (in m/s) are shown in the left margin.

For example : strong wind on March 23rd ; normal wind (for the season) from March 16th to and including March 20th.

- *Wrap-up* : we see that during this lunation starting March 9th 2016 minimum temperatures (lower part of the graph **t**) were below the normal during the first two lunar phases, and they went up after full Moon. About rain : little rain during the first two phases, then more rain during the third phase, and even more and more rain after the last quarter. We also see that the wind (graph **v**, at the bottom) went up right before the full Moon and that the most windy phase of this lunation was the third one.

### 3.2.2 important notice about calculation of the normal and mean values and deviations

Normal values used in these documents to evaluate deviations from the mean value **are not** the ones used by official weather services. Normal values used by Meteo-France are those covering a thirty years period of time. In this document, mean values are calculated from data sets covering 23,66 years (January 1996 to August 2019). Also, they are calculated by groups of 10 days. Therefore, they cannot be considered as “normal” values. These mean values are used in temperature and wind parameters.

Deviations are always written *in italics*. They show how an actual value differs from the mean value. In this document, a deviation has a value going from -5 to +5. Notice that these numbers

*do not* indicate a difference in degrees C (for temperatures) or in m/s (wind speed)! Deviations are established as follows : all the values for a given weather parameter are classified in 10 classes : 5 classes for values greater than the average (numbers going from +1 to +5.), and 5 classes for values lower than the average (numbers going from -1 to -5.). A value that is equal to the average has, of course, an deviation of 0.

## 4 How to use this document

All the lunations and season from January 1996 to August 2019 make up a unique .pdf file which contains several hundreds of pages. Needless to say that, for environment's sake, you must not print it! Perhaps you will want to print just a few pages if you wish to study them in detail.

Fortunately, there is an [index](#) to easily navigate inside this file. Click on the name of the chart you want to see, and you'll get to the right page. When on that page, click on [INDEX](#) (at center top of the page) to go back to the index. To go to the table of contents, just click on "[table des matières](#)".

This index will help you to focus on a particular field of research. Apart from a classical chronological order index, there are several groups made according to specific weather parameters : for example, lunar phases with no rain at all, that you will compare with lunar phases with much rain ; phases with very high temperatures and phases with very low temperatures ; etc. When appropriate, the criteria used to create these groups are explained. No group has been created based on astrological properties : everyone is free to analyse these charts with his/her own methods... .

## 5 A final word ...

I will be glad to read your suggestions and — most wished — discoveries in the field of astrometeorology. If you find errors, please let me know.

I am open to the idea of making the same kind of files for other locations in the world, provided that SYNOP weather data for at least 20 years are available (that is 8 data sets/day for every parameter under review ; see <http://worldweather.wmo.int/en/home.html>) and that you agree to, eventually, check or correct the data for months where data is missing.

Thanks to Catherine Sinclair ([info@astrocaptain.com](mailto:info@astrocaptain.com)) for helping me with the English version.  
Wishing you great research !

[mc.astro@orange.fr](mailto:mc.astro@orange.fr) – Lyon, September 20 2019

---

You will find all charts and weather data on the .pdf file freely available on the Internet. When downloaded, you can work on it offline.

To download this file (24Mo, 700 pages ; may take a while...) go to  
<http://www.cedra.net/mc-astro/en>

---

and click on « download the pdf file ». Then the downloaded document will be in your download directory.

## 6 Index by weather categories

Grouping lunar phases according to different weather types. English text *in italics*. Links will work on the downloaded version only, which contains the entire set of charts and graphical weather data.

*no rain at all*
- 127** : pluie pendant au moins 5 jours d'affilée (41 cas)  
*rain during at least 5 days in a row*
- 128** : pas de pluie pendant au moins 5 jours d'affilée (68 cas)  
*no rain during at least 5 days in a row*
- 129** : ciel dégagé pendant au moins 3 jours d'affilée (16 cas)  
*clear sky during at least 3 days in a row*
- 130** : ciel couvert pendant au moins 3 jours d'affilée (25 cas)  
*clear sky during at least 3 days in a row*
- 132** : très net changement de température (47 cas)  
*sharp change in the temperatures*

- 134** : brusque et net réchauffement du jour au lendemain (60 cas)  
*temperature went up from one day to another*
- 136** : brusque et net refroidissement du jour au lendemain (49 cas)  
*temperature went down from one day to another*
- 138** : fort réchauffement au cours de la phase lunaire (85 cas)  
*temperature went up during the lunar phase*
- 140** : fort refroidissement au cours de la phase lunaire (111 cas)  
*temperature went down during the lunar phase*
- 141** : températures maximales pratiquement stables (47 cas)  
*steady maximum temperatures*
- 143** : températures minimales pratiquement stables (56 cas)  
*steady minimum temperatures*
- 145** : températures maximales et minimales pratiquement stables (19 cas)  
*steady maximum and minimum temperatures*
- 146** : températures maximales et minimales sans grand changement (59 cas)  
*pretty steady maximum temperatures*

*Lunar phase compared to previous or next lunar phase :*

- 201** : la pluie, même faible, arrive après 2 phases lunaires sans aucune pluie (18 cas)  
*rain is coming (1)*
- 202** : la pluie arrive vraiment après 2 phases lunaires avec peu (ou pas de pluie (33 cas)  
*rain is coming (2)*
- 203** : une troisième phase lunaire d'affilée sans aucune pluie (5 cas)  
*no rain during 3 lunar phases in a row*
- 204** : une troisième phase lunaire d'affilée avec très peu ou pas de pluie (15 cas)  
*no rain or just little rain during 3 lunar phases in a row*
- 205** : la pluie cesse complètement après deux phases lunaires pluvieuses (15 cas)  
*rain completely stops after two rainy lunar phases*
- 206** : la pluie cesse presque complètement après deux phases lunaires pluvieuses (33 cas)  
*after two rainy lunar phases, a lunar phase with no just a little rain*
- 207** : phase lunaire pluvieuse entre deux phases sans pluie (5 cas)  
*rainy lunar phase between two phases without rain*
- 208** : phase lunaire pluvieuse entre deux phases sans pluie ou faiblement pluvieuses (13 cas)  
*rainy lunar phase between two phases with no rain but a little*
- 209** : phase lunaire sans pluie entre deux phases pluvieuses (13 cas)  
*lunar phase witout rain between two rainy phases*
- 210** : phase lunaire sans pluie ou très peu de pluie entre deux phases pluvieuses (27 cas)  
*lunar phase with no rain or just little rain between two rainy phases*
-
